FEB 13 1961
WEATHER BUREAU

General Summary of Weather Conditions

December 1960 was mild in many parts of Canada. The Yukon Territory enjoyed mean temperatures for the month twelve to sixteen degrees above normal, while there were smaller excesses on the Arctic Archipelago and in the Prairie Provinces. Ontario and Quebec, on the other hand, experienced deficiencies of two to six degrees. Precipitation was generally somewhat below normal for the month, particularly along the British Columbia coast and southern interior valleys, and in southern Ontario. Other sections of the country experienced excesses and deficiencies equally frequently.

At the end of the first week in January a series of strong cyclones developing over the Pacific Ocean gave a ridge of high pressure aloft over Western North America and a trough of low pressure across the lower lakes and Eastern United States. As a result the predominant storm tracks were eastward across British Columbia and northeastward across the Maritimes.

In the Province of British Columbia December was a more temperate month than is usually the case. Fewer storms than usual moved from the Pacific Ocean particularly in the southern sections, and there were no invasions of cold air westward across the mountains. As a result temperatures in southern sections were within one degree of normal while in the central and northern sections there were excesses of mean temperature ranging to ten degrees in the Peace River District. Along the coast there were generally excesses ranging from one degree in the south to five degrees in the north.

Precipitation was generally light over British Columbia. Vancouver Island, the Fraser Delta, and most of the southern interior valleys experienced deficiencies of December precipitation ranging from thirty to sixty per cent. In the central sections of the Province there were a few excesses of ten or twenty per cent, but most stations experienced deficiencies which ranged to eighty per cent.

The settled nature of the weather was indicated by the establishment of a new record high of 65.3 hours of sunshine against a normal 44 hours at Vancouver Airport. Although gale force winds were reported on twenty-four days near the southern part of the Queen Charlotte Islands, at most places in the Province strong winds were recorded on only one to two days of the month.

December was mild in the Provinces of Alberta and Saskatchewan. The greatest excesses of monthly mean temperature were experienced in the Peace River District, where they ranged from eight to ten degrees Excesses of six to eight degrees were experienced in the Edmonton region and the vicinity of Battleford. The remaining parts of the two provinces experienced excesses of two to six degrees.

December precipitation was above normal in the part of Alberta south of Edmonton, with stations at Gleichen, Olds and High River reporting well over twice the normal fall. There were deficiencies in the Waterton Lakes region ranging to forty per cent. Precipitation was also less than normal in the upper parts of the Athabasca and Peace River Valley with deficiencies ranging from twenty-five to eighty per cent. In the lower parts of these rivers on the other hand there were generally excesses, notably at McMurray where there was two and a half times the normal fall. The distribution of precipitation over Saskatchewan was generally spotty with no particular pattern evident, the range being from deficiencies of eighty per cent to excesses as big. There were no major storms during the month although on the 18th to 20th a storm gave strong winds and snow which approached near blizzard proportions in some southern sections. A rain storm moving from the Peace River country to Edmonton on December 21st and 22nd brought freezing rain for a short time but this was fortunately followed by a chinook.

In the Province of Manitoba the first few days of December were mild with many stations reporting their highest temperature on the 3rd. This was followed by a cold spell which brought temperatures down to 20 below zero or colder at many stations on the 8th, while the second half of the month was generally cold. Mean temperatures for the month were one to three degrees below normal throughout the Province, except for one or two stations in the Minnedosa area where there were one degree excesses.

On the 5th a severe storm brought four to five inches of snow and near blizzard conditions to southeastern Manitoba, while the adjacent parts of Ontario received freezing rain. In southern Manitoba the range was from excesses of eighty per cent to deficiencies of forty per cent. In the northern half of the Province there were generally deficiencies which ranged to eighty per cent.

December was a cold month in the Province of Ontario. All sections of the Province reported temperature deficiencies, the greatest being six degrees at Nakina, Pagwa, and in the southwestern section of the Province at Windsor. Deficiencies were one or two degrees in the Ottawa region, but throughout the remainder of the Province they range from three to five degrees. Coldest day of the month was the 31st when Island Falls reported 45 below zero, the coldest in the Province for the month.

Because of cold weather rainfall was very much below normal. In southern Ontario precipitation was generally fifty to seventy per cent below normal except for a few stations in the lee of Lake Huron, where snowfall from the lake increased the total to normal or slightly above. The greatest snowfall in the Province was reported at Wiarton which recorded forty-five inches. In the districts of Kenora and Rainy River the storm of the 5th brought freezing rain and snow to increase the month's total to normal or above, Fort Frances experiencing twice the normal fall. Elsewhere in northern Ontario precipitation was normal to sixty per cent below normal.

December mean temperatures were generally below normal throughout the Province of Quebec. The greatest deficiency was six degrees below normal, reported from Fort George, while other stations in the central part of the Province had deficiencies of three to five degrees. In the Ottawa River Valley and the Eastern Townships there were also deficiencies ranging from one to three degrees. By contrast, on the Gaspe Peninsula there were excesses of one to three degrees, while in the far north Port Harrison reported the greatest excess of any station in the Province - four degrees.

In the southern part of the Province of Quebec precipitation ranged from twenty per cent above normal to fifty per cent below normal,with two-thirds of the stations reporting deficiencies. Most of the stations in the central part of the Province experienced excesses averaging about fifty per cent, but in the extreme far north there were deficiencies of ten to fifty per cent. In the Maritime Provinces December weather was marked by the passage of a number of intense low pressure areas. The first of these moved past the southern tip of Nova Scotia on the 12th, then turned northward across Prince Edward Island to the Gulf of St. Lawrence. This was followed on the 17th by another extremely deep and active storm which moved from Eastport, Me., over Campbellton. Other storms effected the area on the 20th, 21st, 23rd and 27th. Despite all this cyclonic activity, precipitation totals for the month were below normal in the Province of Nova Scotia, where deficiencies ranged to thirty per cent. In New Brunswick on the other hand, there were generally excesses ranging to ninety per cent, but averaging about fifty per cent. On Prince Edward Island the range was from twenty per cent above normal to thirty per cent below.

The first week of December was mild in the Maritime Provinces followed on the 8th by dropping temperatures. A mild spell that began on the 12th lasted until the 23rd, with occasional temperatures reaching the fifties at some points during this period. For the month as a whole, temperatures ranged from two degrees below normal to two degrees above in Nova Scotia, and from normal to two degrees above normal on Prince Edward Island and in New Brunswick.

For the year 1960 as a whole a number of interesting records were set in the Maritimes. At Halifax, Campbellton, Chatham and Fredericton new records were set for the greatest number of hours of sunshine. The yearly snowfall of 141.8 inches at Halifax exceeded the previous record fall of 133.5 inches, set in 1882, while at the same station the rainfall of 28.50 inches was less than the previous record low for a year 32.73 inches, set in 1955.

On the Island of Newfoundland mean temperatures for December were generally above normal by one or two degrees. Rainfall amounts were generally below normal, but Cape Race was a notable exception with 6.09 inches against a normal of 4.27 for the month. Snowfall amounts were generally below normal in the southeastern parts of the Island, and above the average in the central and western sections. Snowfall was a result of a number of minor storms and no heavy fall was experienced at any one time. Precipitation for the month was twenty to thirty per cent below normal in the central and eastern sections, ranged to twenty per cent above normal along the south coast, and was forty per cent above normal at Daniel's Harbour on the west coast. The month was sunnier than usual, St. John's Airport reporting eighty-four hours of sunshine,which is thirty hours above the average, while a similar record was set at Gander.

December was very mild in the Yukon Territory, with mean temperatures ranging from ten to sixteen degrees above normal, the latter excess being reported from Mayo. This was the highest positive anomaly recorded in Canada during the month. There was an excess of precipitation at Teslin of sixty per cent but all other stations in the Yukon Territory experienced deficiencies ranging from twenty per cent to sixty-five per cent.

Mean temperatures were also much above normal during December in the mainland districts of the Northwest Territories. Excesses above normal ranged from ten degrees at Normal Wells to one degree at Ennadai Lake. In the central part of the Arctic Archipelago there were also excesses of mean December temperature the greatest being eight degrees at Cambridge Bay.
